CATEGORY 5 SUPER 350 ENHANCED (CAT5e) PATCH CABLES

With a 350-MHz frequency range, these cables are ready for the next generation of LAN equipment.

Frequency (MHz)	4	8	10	16	25	31.3	62.5	100	155	200	310	350
Max. Attenuation (dB/100 m)	4.8	6.8	7.7	9.8	12.4	13.9	20.2	26.1	33.2	38.4	49.5	52.9
Min. NEXT (dB)	53	48	47	44	41	40	35	32	30	28	25	24

Key Features

- ▶ ***The cables you need for frequent plugging and unplugging.***
- ▶ ***Stranded cables stand up to bending.***
- ▶ ***Colour cables make it easy to follow your wiring.***
- ▶ ***Built to meet future application standards.***
- ▶ ***Reduce crosstalk.***

There are monsters in your wiring closet. They're like a many-headed hydra always snagging after you and disrupting your communications. What are they? Your old patch cables.

Triumph over beastly wiring with our CAT5™ Super 350 Enhanced (CAT5e) Colour Patch Cables.

Constructed from approved Level 6 cable, they feature molded, snag-free boots. Cable kinks and bent pins caused by frequent plugging into and unplugging from patch panels are eliminated—which means crosstalk is reduced.

These cables also provide more than triple the frequency range of ordinary Category 5 cables, which handle emerging 100-MHz applications. Because Enhanced Colour Patch Cables provide 350-MHz performance, think how long they'll work for you!

To find out more about these Cables, call Black Box Tech Support.

How the Cables Are Pinned and Paired . . .

Pinouts

Straight-through pinning

RG568B Pairing

USOC Pairing

Standard 4-Pair Wiring Colour Codes

Pair 1	T	White/Blue	Pair 3	T	White/Green
	R	Blue/White		R	Green/White
Pair 2	T	White/Orange	Pair 4	T	White/Brown
	R	Orange/White		R	Brown/White

NOTE: For 6-wire jacks use pair 1, 2, and 3 colour codes. For 4-wire jacks use pair 1 and 2 colour codes.

Technically Speaking: Why stranded cable?

When you're making connections between a workstation and a wallplate, or anywhere else where you'll be running patch cables in the open through the office, you have to expect those cables to take a lot of abuse. They'll be plugged in

and unplugged. They'll be pushed impatiently out of the way. They'll be shoved into corners and bent around desks.

Stranded cables stand up to that kind of abuse much better than solid-conductor cables, where the single conductor could

easily break if you bend the cable too far.

The trade-off is that attenuation is higher in stranded cables than in solid cables. That's why it's best to use solid cables for the backbone cable in your network.

It's best, in fact, to keep lengths of stranded cable under 6 m (20 feet). Longer runs risk

adding more attenuation to your system.

The bottom line: Use stranded cables like these wherever you have short runs of cable that need to survive the thousand natural shocks that cables are heir to. If you're planning a long run, use one of our solid-conductor cables—and make sure it's protected.
