

ServSwitch Multi™ Rackmount Kit

Use a ServSwitch Multi™ Rackmount Kit (our product code RMK19J) to mount a ServSwitch Multi (our product code KV150A or KV160A) in a 19" rack. Each of these Kits consists of two rackmounting side brackets and ten screws. To use a Kit to mount a ServSwitch Multi, take these steps, referring to the illustration below:

1. Remove the five screws that secure each side of the housing of the ServSwitch Multi. (If you might ever be using the Switch as a standalone unit again, save these screws; otherwise, do whatever you want to with them, because you will *not* be reusing them in the rackmounted setup.)
2. Line up the holes in the "long side" of the Kit's side brackets with the screwholes in the ServSwitch Multi.
3. Thread the screws that came with the Rackmount Kit through the holes in each of the Kit's side brackets, into the screwholes on the ServSwitch Multi. *Don't* tighten any of the screws on either side of the Switch until all five of that side's screws have been partially threaded.
4. Completely tighten (but *don't* overtighten) all of the screws you've just threaded.
5. Once the rackmount assembly is ready, match the holes in the "short side" of each bracket to an appropriate set of matching holes on your equipment rack, then fasten the assembly to the rack using your own screws, bolts, or cage nuts (not included).
